

For our project, we decided to make a quiz inspired by BuzzFeed; ours is centered around “What’s Your Karaoke Song Based on SPIS?”. We formatted our quiz to have a homepage that would link to the questions, each with their own individual files, to eventually end with the result. Our quiz has ten questions, and each question has three choices. There are only three results, and the result is based on the majority of the selected choices. We managed to make the home page with HTML, and we used Python to link the homepage to the first question; in this way, we managed to create our minimal viable product. We found that it was difficult to format our question, but eventually managed to center the results, each with their own images. Storing the data was the next challenge, and with help from the mentors, we were able to do it through Python. Now, the next step is formatting each of the questions with the images, and inserting the song clips in the end.
